Projects: 49**

Scale of project risk

Rating	Explanation
0	The only way this goes away is if owasp.org disappears off the Internet
1-3	Stable project, multiple releases, high likelihood of sustainability
4-6	Newer project, fewer releases
7-9	Older project with a lack of updates within the last year
10	If I added one of these to this project, I should have my head examined

NOTICE

Use OWASP projects with caution. There is no guarantee that a project will ever be updated again.

Delivery of awareness
and education

Administration of the
training platforms

Awareness and education: impact and headcount

Awareness

- Foundational understanding of the most important concepts in AppSec

Knowledge

- A concise reference for solving the most difficult AppSec problems
- Secure coding examples in multiple languages

Hands-on training

- Assimilation of key concepts through activities that lock in knowledge and make it practical

Awareness and education: getting started

Awareness

- Lunch and learn sessions to teach the basics of all awareness documents

Knowledge

- Teach developers about available cheat sheets
- Host an internal copy of the cheat sheets
- Lead a training session covering the three most crucial cheat sheets for your organization

Hands-on training

- Build an environment that hosts the different training apps
- Schedule a hack-a-thon where teams gather together and work on the vulnerable apps in teams and learn from each other

Process and Measurement

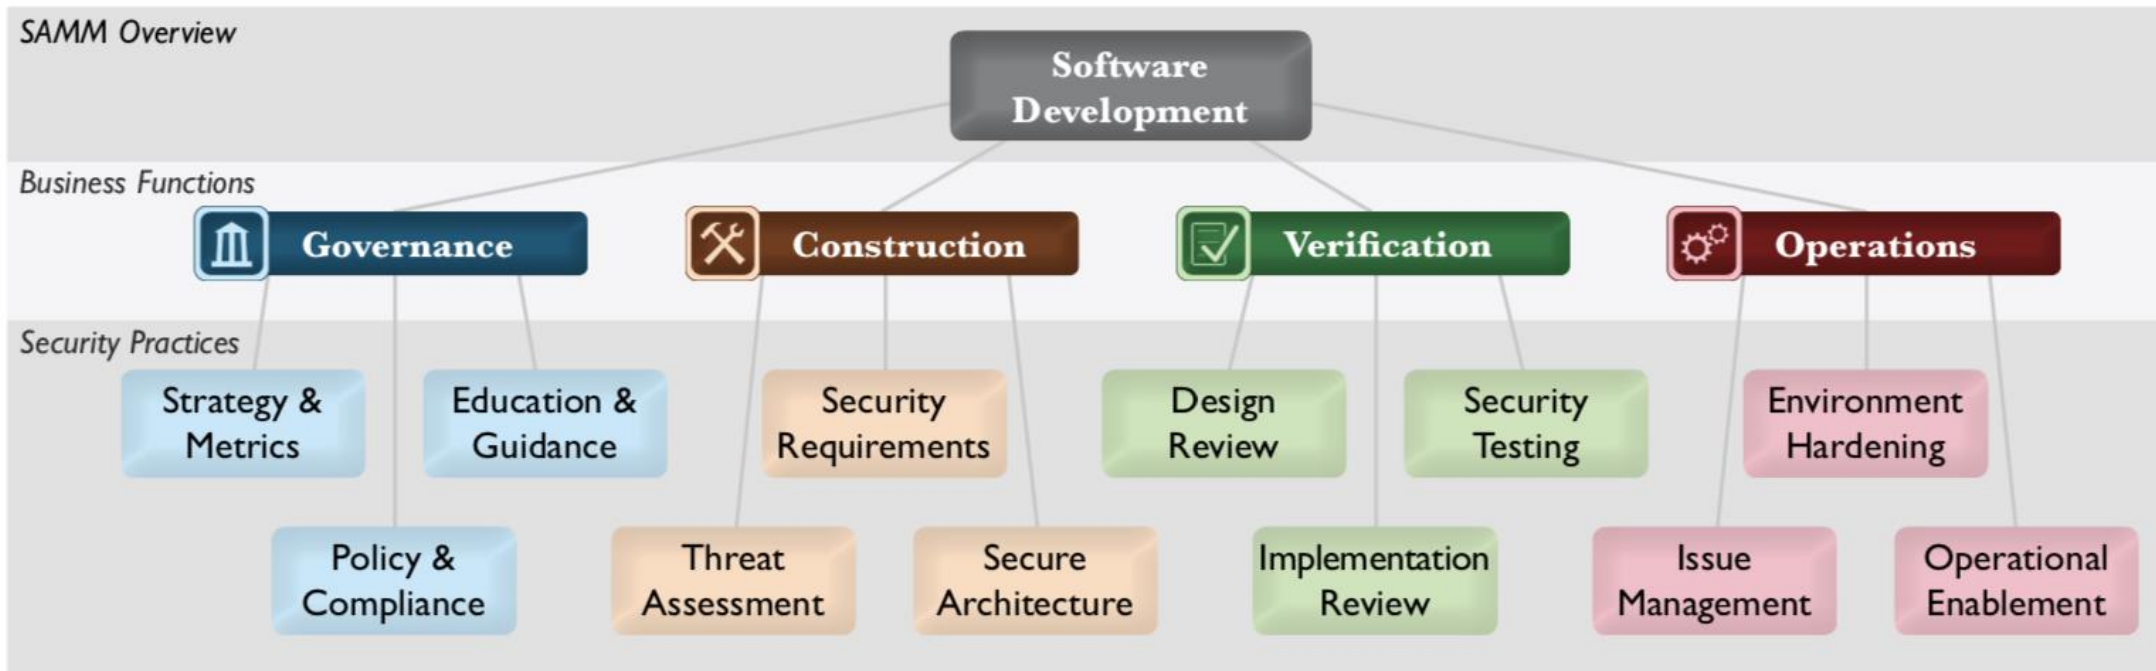

Application Security Verification Standard

REVIEW
GUIDE

Application Threat Modeling

https://www.owasp.org/index.php/OWASP_SAMM_Project

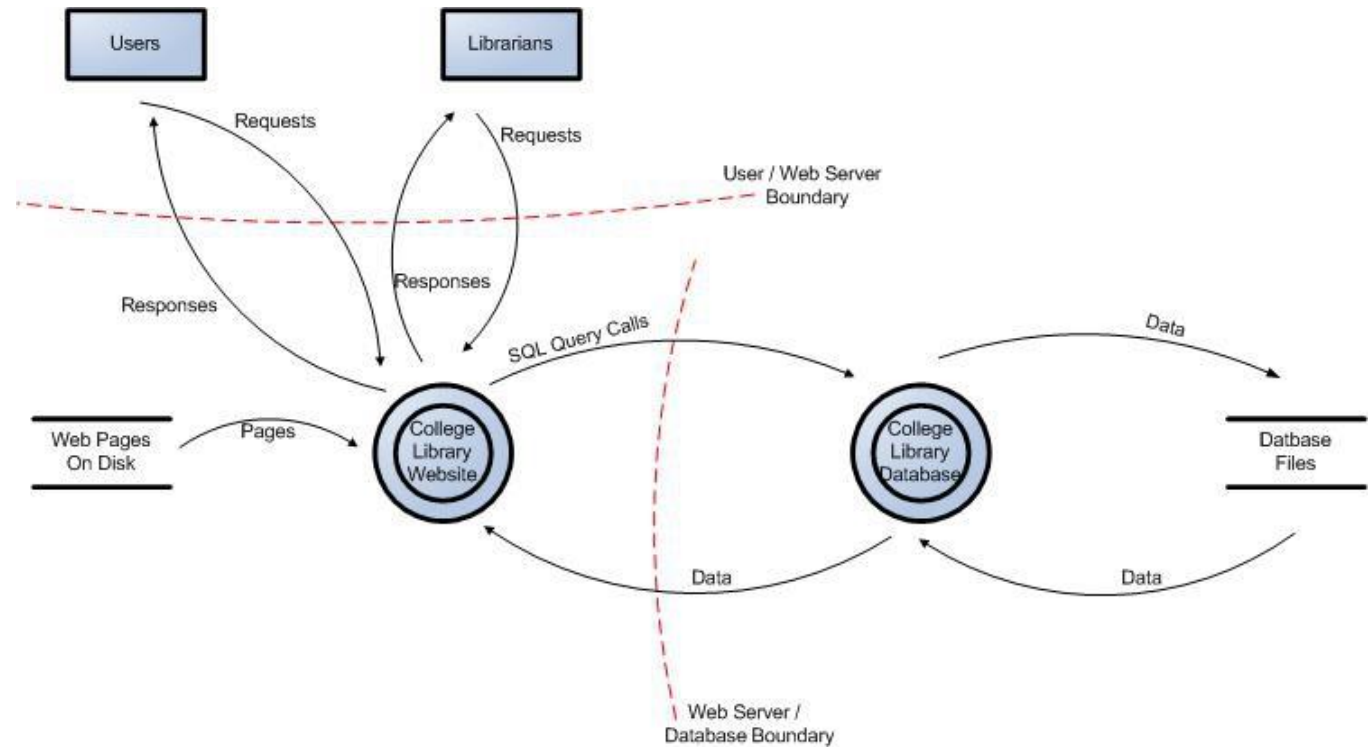

- 0** Implicit starting point representing the activities in the practice being unfulfilled
- 1** Initial understanding and adhoc provision of security practice
- 2** Increase efficiency and/or effectiveness of the security practice
- 3** Comprehensive mastery of the security practice at scale

Requirement	
V1. Architecture, design and threat modelling	V11. HTTP security configuration
V2. Authentication	V13. Malicious controls
V3. Session management	V15. Business logic
V4. Access control	V16. File and resources
V5. Malicious input handling	V17. Mobile
V7. Cryptography at rest	V18. Web services
V8. Error handling and logging	V19. Configuration
V9. Data protection	V11. HTTP security configuration
V10. Communications	

Application Threat Modeling

- 1 What
- 2 Why
- 3 4 Questions
 - 3.1 1. What are we building?
 - 3.2 2. What can go wrong?
 - 3.3 3. What are we going to do about that?
 - 3.4 4. Did we do a good enough job?
- 4 Process
 - 4.1 When to threat model
 - 4.2 Threat modelling: engagement versus review
 - 4.3 Validating assumptions
- 5 Learning More
 - 5.1 Agile approaches
 - 5.2 Waterfall approaches
- 6 Additional/External references

- » One-stop source of truth for vuln findings.
 - Open source vulnerability management tool that streamlines the testing process.
- » Goal: make optimizing vulnerability tracking less painful and reduce the amount of time security professionals spend logging vulnerabilities.
- » AppSec Programs, QA, Pen Testers
 - Imports for common vuln scanners.
 - Custom report generation.
 - Metrics and dashboards.
 - App & infra findings supported.

The screenshot displays the Defect Dojo web interface for a project named 'Bodgelt'. The interface includes a navigation sidebar on the left with icons for home, menu, mail, star, users, documents, charts, profile, calendar, settings, and help. The main content area shows the project name 'Bodgelt' with a red 'F' icon and the label 'vulnerable'. Below this are tabs for 'Overview', 'Metrics', 'Engagements' (38), 'Findings' (204), and 'Endpoints' (27). The 'Description' section lists features: 'Easy to install - just requires java and a servlet engine, e.g. Tomcat', 'Self contained (no additional dependencies other than to 2 in the above line)', 'Easy to change on the fly - all the functionality is implemented in JSPs, so no IDE required* Cross plat', 'Open source* No separate db to install and configure - it uses an 'in memory' db that is automatically up', and 'More testing'. The 'Metrics' section shows a bar chart with five categories: CRITICAL (0), HIGH (33), MEDIUM (80), LOW (85), and INFORMATIONAL (6). The 'Technologies' section lists 'Apache 2.0' with version 'v.1'. The 'Regulations (1)' section lists 'GDPR EU & EU Data Extra-Territorial Appli'.

Principles and techniques of testing

Reporting

Phases of a test

How to Test

Black Box testing

A black-box test will include at least three phases:

[1] Detect input vectors. For each web page, the tester must determine all the web application's user-defined variables and how to input them. This includes hidden or non-obvious inputs such as HTTP parameters, POST data, hidden form field values, and predefined radio or selection values. Typically in-browser HTML editors or web proxies are used to view these hidden variables. See the example below.

[2] Analyze each input vector to detect potential vulnerabilities. To detect an XSS vulnerability, the tester will typically use specially crafted input data with each input vector. Such input data is typically harmless, but trigger responses from the web browser that manifests the vulnerability. Testing data can be generated by using a web application fuzzer, an automated predefined list of known attack strings, or manually.

Some example of such input data are the following:

```
<script>alert(123)</script>
```

```
"><script>alert(document.cookie)</script>
```

For a comprehensive list of potential test strings, see the [XSS Filter Evasion Cheat Sheet](#).

[3] For each test input attempted in the previous phase, the tester will analyze the result and determine if it represents a vulnerability that has a realistic impact on the web application's security. This requires examining the resulting web page HTML and searching for the test input. Once found, the tester identifies any special characters that were not properly encoded, replaced, or filtered out. The set of vulnerable unfiltered special characters will depend on the context of that section of HTML.

Ideally all HTML special characters will be replaced with HTML entities. The key HTML entities to identify are:

```
> (greater than)  
< (less than)  
& (ampersand)  
' (apostrophe or single quote)  
" (double quote)
```

However, a full list of entities is defined by the HTML and XML specifications. Wikipedia has a complete reference [1].

Within the context of an HTML action or JavaScript code, a different set of special characters will need to be escaped, encoded, replaced, or filtered out. These characters include:

```
\n (new line)  
\r (carriage return)  
\' (apostrophe or single quote)  
\" (double quote)  
\\ (backslash)  
\uXXXX (unicode values)
```

For a more complete reference, see the Mozilla JavaScript guide. [2]

Example 1

For example, consider a site that has a welcome notice "Welcome %username%" and a download link.

The tester must suspect that every data entry point can result in an XSS attack. To analyze it, the tester will play with the user variable and try to trigger the vulnerability.

Let's try to click on the following link and see what happens:

```
http://example.com/index.php?user=<script>alert(123)</script>
```

If no sanitization is applied this will result in the following popup:

- Why mobile application security?
 - Different attack surface
 - Local storage
 - Local authentication
 - OS interaction
 - Different vulnerabilities
 - Reverse engineering
 - Secret storage
 - Fewer to NO XSS or CSRF

- Mobile security testing guide
- Maps directly to MASVS
- Native Android and iOS applications
- Uses OWASP testing guide for server side

- Mobile Application Security Verification
- 3 levels of requirements
 - Baseline
 - Defense-in-depth
 - Advanced
- Fork of ASVS dedicated to mobile

End-to end SDL or Secure SDLC

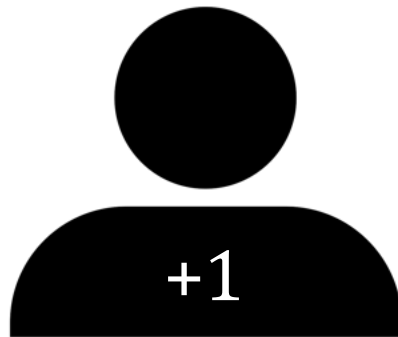

Program metrics

Deployment advice/experience on
how to be successful

Process and measurement: impact and headcount

Process

- ASVS provides important requirements
- App threat modeling defines the process with examples
- Code review guide describes how to perform a code review and what to look for
- Testing guide provides how to test and a knowledge base of how to exploit vulnerabilities

Measurement

- A roadmap to where you are today, and a plan for where you want to go with your AppSec program

Process and measurement: getting started

Process

- Choose one of the process areas to start with (threat modeling) and build out this activity as your first
 - Early wins are key

Measurement

- Perform an early assessment to determine where you are
- Map out a future plan for where you want to get to
- Share these assessments with Executives and Security Champions (and anyone else that will listen)
- Advocate for Executive support on your plan to build a stronger AppSec program

Web app

https://www.owasp.org/index.php/OWASP_Zed_Attack_Proxy_Project

No options for SAST or IAST

A dashboard to track everything
(requirements management,
activities, releases, metrics)

Design

- Threat dragon provides a new, web based approach to capturing threats that will reach Enterprise status if it delivers on the roadmap

Infrastructure

- CRS provides a true WAF solution
- Dependency check identifies vulnerable 3rd party software
- Dependency track provides Enterprise 3rd party software tracking
- ZAP provides DAST, and plugs in to any dev methodology

Tools: getting started

Design

- Use threat dragon as the tool to teach threat modeling and scale it across your development teams
 - Partner with application threat modeling knowledge

Infrastructure

- Add Dependency Check to your build pipeline tomorrow
- Teach ZAP to Security Champions and interested testers
- Work with your infra owner to deploy a test of ModSecurity + CRS

SDL phase view

Final thoughts for an AppSec program on the cheap

1. Use Open SAMM to assess current program and future goals.
2. There is no OWASP SDL; build/tailor required.
3. Start small; choose one item for awareness and education to launch your program.
4. Build security community early; it is the support structure.
5. Evaluate available projects in each category and build a 1-2 year plan to roll each effort out.
6. While OWASP is free, head count is not; plan for head count to support your “free” program.

Q+A and Thank you!
